

Algoritmos e Linguagem de Programação

Capitulo 6

Programação com Matrizes

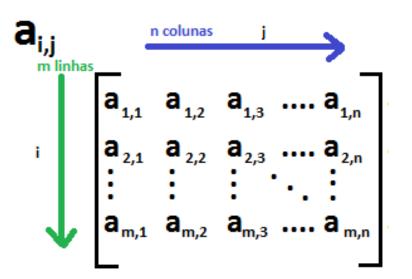

Prof. Me. Renato Carioca Duarte

Matriz na Matemática

$$A = \begin{bmatrix} 1 & 0 & 2 & 0 \\ 2 & 1 & 1 & 1 \\ 2 & 3 & 0 & 1 \\ -1 & 1 & 2 & 2 \end{bmatrix}$$

Matriz m por n

- Uma matriz de uma dimensão (também chamada de vetor) é um tipo de estrutura de dados que armazena uma coleção de dados homegênea, ou seja, do mesmo tipo de dado
- A matriz usa uma única variável, que tem determinado tamanho e pode armazenar mais de um valor (conhecido como elemento).
- Os nomes dados às matrizes seguem as mesmas regras de nomes atribuídos a variáveis simples.
- A instrução para declaração e criação de um vetor tem a seguinte sintaxe:

```
tipo[] nome = new tipo[dimensão];
```

<tipo> - o tipo de dado que será armazenado;

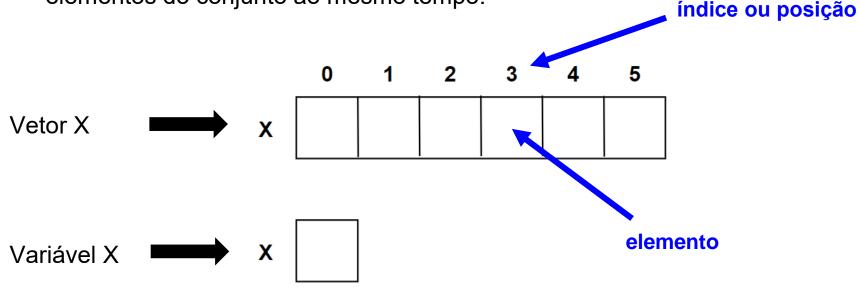

<nome> - o nome atribuído à matriz (vetor);

<dimensão> -o tamanho em número de elementos a serem armazenados.

- Uma variável pode conter apenas um valor por vez.
- No caso de uma matriz, ela pode armazenar mais de um valor por vez, pois é dimensionada exatamente para essa finalidade.

 Vale ressaltar que a manipulação dos elementos de uma matriz ocorre de forma individualizada, pois não é possível usar todos os elementos do conjunto ao mesmo tempo.

```
public static void Main (string[] args) {
  int [] vetor = new int [10];
 vetor[0]= 76;

```

 O programa abaixo mostra como podemos criar um vetor e inicializá-lo com valores no momento de sua criação.

```
public static void Main (string[] args)
{
   int [] v = {21,11,43,56,82};

   for (int i=0; i<5; i++)
   {
        Console.WriteLine (v[i]);
    }
}</pre>
```

 O programa abaixo mostra como podemos criar um vetor e inicializá-lo com valores no momento de sua criação.

```
public static void Main (string[] args)
{
   int [] v = {21,11,43,56,82};
   for (int i=0; i<5; i++)
   {
        Console.WriteLine (v[i]);
    }
}</pre>
```

- Fazer um programa onde o usuário digita 5 números e o programa mostra os números invertidos.
- Quais são as entradas e saídas do programa?

 Fazer um programa onde o usuário digita 5 números e o programa mostra os números invertidos.

RESPOSTA:

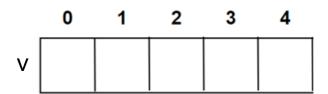

```
public static void Main (string[] args)
  int [] v = new int[5];
 for (int i=0; i<5; i++)
  v[i]=int.Parse(Console.ReadLine());
 Console.WriteLine ("Imprime invertido:");
 for (int i=4; i>=0; i--)
    Console.WriteLine (v[i]);
```

```
public static void Main (string[] args)
{
  int [] v = new int[5];
  for (int i=0; i<5; i++)
  {
    | v[i]=int.Parse(Console.ReadLine());
    }
    Console.WriteLine ("Imprime invertido:");
    for (int i=4; i>=0; i--)
    {
        | Console.WriteLine (v[i]);
    }
}
```

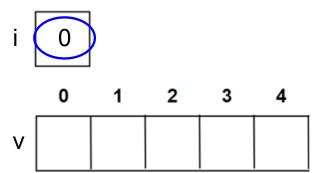

```
public static void Main (string[] args)
{
   int [] v = new int[5];
   for (int i=0; i<5; i++)
   {
      | v[i]=int.Parse(Console.ReadLine());
      }
      Console.WriteLine ("Imprime invertido:");
      for (int i=4; i>=0; i--)
      {
            | Console.WriteLine (v[i]);
      }
}
```

```
public static void Main (string[] args)
{
   int [] v = new int[5];
   for (int i=0; i<5; i++)
   {
      v[i]=int.Parse(Console.ReadLine());
   }
   Console.WriteLine ("Imprime invertido:");
   for (int i=4; i>=0; i--)
   {
      Console.WriteLine (v[i]);
   }
}
```

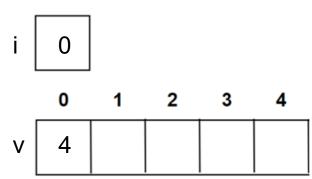

```
public static void Main (string[] args)
                                                         1
                                                               2
                                                                    3

- Além da forma que temos de organizar os dados em uma lista de valores como a que usamos no tópico anterior podemos organizar os dados na forma de tabelas com matrizes de duas dimensões.
- Em matrizes com mais de uma dimensão, os elementos também são manipulados individualmente, com a referência feita sempre por meio de dois índices: o primeiro para controlarmos a linha; o segundo, para controlarmos a coluna.
- Uma matriz de duas dimensões sempre faz menção a linhas e colunas e será representada por seu nome e tamanho máximo (dimensão) entre colchetes, com a seguinte sintaxe:

```
tipo[,] nome = new tipo[linhas, colunas];
<tipo> - o tipo de dado que será armazenado;
<nome> - o nome atribuído à matriz
linhas> - tamanho de linhas para a matriz;
<colunas> - tamanho de colunas para a matriz;
```

Exercícios

- Faça um programa que leia um vetor de números inteiros N[20]. A seguir, encontre o menor elemento do vetor N e a sua posição dentro do vetor, mostrando: "O menor elemento de N é ..., e sua posição dentro do vetor é:...".
- 2. Faça um programa que, usando vetor, armazene as idades de quarenta alunos e exiba na tela a média de idade, a maior idade e a menor idade desses alunos.
- Faça um programa que leia 10 números inteiros do teclado e os armazene num vetor. Depois, percorrer esse vetor mostrando os números ímpares.
- 4. Colocar num vetor os números entre 10 e 1 e depois mostrar de forma invertida.
- 5. Colocar num vetor os números entre 1 e 10 e depois mostrar somente os pares.

Exercícios

- 6. Faça um programa que leia 10 números inteiros, e os armazene em um vetor, e um valor inteiro x, e exiba a quantidade de vezes que x aparece nesse vetor.
- 7. Entrar com o nome e nota final de 10 alunos e depois mostrar somente o nome e média dos alunos que tiraram nota acima de 5,0
- 8. Faça um programa que leia 10 números inteiros do teclado e os armazene num vetor. Depois, percorrer esse vetor e contar quantos desses números são pares e impares.
- 9. Faça um programa que receba 16 números inteiros e os armazene em uma matriz 4x4, e depois exiba o conteúdo dessa matriz.
- 10. Faça um programa que receba os valores para uma matriz inteira 2x4, gere e exiba na tela uma matriz transposta (4x2). Uma matriz transposta é gerada trocando a linha pela coluna.
- 11. Faça um programa que some duas matrizes A e B (4x2) e armazene o resultado em uma matriz C. Inicialize os valores de A e B.
